

# BitTitan DeploymentPro

## Automatic Outlook Configuration for Office 365

Migrating to Office 365 is enough of a challenge without having to spend time configuring each user's desktop individually. BitTitan's DeploymentPro allows you to automatically configure Outlook 2007+ to connect to Office 365, saving you and your employees time and hassle. The simple, customizable wizard automatically and securely creates a new mail profile, and maintains local settings like PST files, signatures, and auto-completes to help make your transition to Office 365 easy and seamless, completely removing the need for the admin to configure each machine individually.

### Easy To Use

After you set your parameters and preferences through the DeploymentPro web-based interface, the built-in wizard does all the work for the end users without the need for any admin credentials. No training or expertise needed – BitTitan does all the heavy lifting for you.

### Customizable

Customize the wizard with your own logo and tagline. You can also customize automated emails to end users so you don't have to individually notify each user on when to update or when the configuration finishes.

### Totally Scalable

DeploymentPro works for SMBs as well as it works for Enterprise level clients. Regardless of your company's size, DeploymentPro can automate your Office 365 migration.

### Hassle Free

Users have the option to silently install the agent via Group Policy. Nothing for end-users to install or manage. End-users simply enter their password and restart Outlook.

### One of a Kind

DeploymentPro is the only totally customizable standalone solution. Other options lack DeploymentPro's project tracking capabilities, depth of customization and additional features.

### Flexible Options

Integrates with MigrationWiz or stands alone, giving users the power to choose the right products for the right project. DeploymentPro is also included as part of BitTitan UserActivation, and is versatile enough to function in any deployment scenario, including tenant to tenant (O365 to O365), big bang, or coexistence migrations.

### Project Management

Track exactly what's going on in real time. Check reporting, review project errors, see who's installed (or hasn't), monitor batch deployment, or set group policy... There's no longer any need to touch an employee's desktop to configure or deploy – ideal for companies with a remote or dispersed workforce.

### Cost-Effective

Lowers total project costs through automation, and doesn't create any expensive downtime for end users. Through the comprehensive web-based portal, companies and IT administrators can manage and optimize the entire Outlook configuration project.

DeploymentPro removes the headache of manual configuration, saving you time while ensuring all your important Outlook settings remain intact when you transition to Office 365. No expensive hardware or personnel required, and only seconds of end user time.
